

		Develop Policy Language
Date Completed	Date Reviewed	
		Develop policy & procedure to use in the facility that reflects the Hazards Vulnerability Assessment (HVA).

	Amounts Needed		
Date Completed	Date Reviewed		
		Determine the amount of water to store for emergencies to include the total bed capacity and additional amounts for staff, visitors and predicted surge or emergency influx of admissions.	
		The quantity of water needed for each individual is not described in the regulations but community standards have been established as follows:	
		 American Red Cross, CDC and FEMA all suggest at least one gallon per person per day for 3 days. This allows two quarts for drinking water and beverages and two quarts for food preparation per person per day. 	
		 The nursing department may want to designate a specific amount of water for nursing procedures, such as enteral feeding flushes, sterile dressing uses, or any other nursing procedure needing bottled or distilled water. 	
		Evaluate essential water needs for environmental cleaning, flushing of toilets, and other critical activities that may require water but could utilize non-potable sources or be met by some alternate plan that does not require water (i.e. environmental wipes, paper supplies for meals, portable toilets).	
		Consider a strategy to monitor water use during an incident to avoid waste and ensure the supply lasts for projected duration, when calculating the minimum amount of water needed on hand for emergencies.	

		Sources
Date Completed	Date Reviewed	
		Bottled water and large storage containers may be included in the emergency supply inventory.
		Consider include ice machines, hot water storage tanks, boilers, toilet storage tanks (not bowls) may be an additional source of safe water to meet total needs of facility.
		Have a plan to communicate with local emergency management and the water company about the situation and to request assistance for your facility.
		Find out how the local authorities advise on how they will alert the community when they identify an anticipated disruption, as well as send recommendations on purification methods and testing.

	Storage and Rotation		
Date Completed	Date Reviewed		
		Follow water storage direction provided by manufacturer of the storage container, as well as guidance from local and state health departments.	
		Store bottled or distilled water for emergency purposes, and label "FOR EMERGENCY USE ONLY". Commercially prepared bottled water is recommended.	
		If used, keep the water in its original sealed container and stored in a cool, dry area away from heat sources.	
		Replace the water per manufacturer directions. Once opened, use it and do not store it further.	
		An agreement from a local bottled water company or supplier to provide bottled water in emergencies may be part of the facility disaster plan.	

	Storage and Rotation - Continued		
Date Completed	Date Reviewed		
		If possible a new tank should be used because used tanks that have contained chemicals can have harmful residue.	
		Clean and disinfect all tanks before and after use. Ensure the tanks meet the NSF/ANSI Standard 61 for potable water use.	
		Carefully consider the location and weight of the filled storage tank/container, for overall planning purposes.	
		A siphon or pump can be used to dispense water from the container. Food grade tubing must be used for siphoning.	
		Follow manufacturer guidelines in terms of location, protection for elements, testing, purifying or preserving and rotation of water.	
		Check stored water regularly to ensure inventory and integrity of the supplies.	
		Instruct staff not to use the emergency water supply for any purpose other than an emergency situation.	

	Distribution to Point of Care		
Date Completed	Date Reviewed		
		Should an emergency occur, dispense water from storage containers following manufacturer guidelines.	
		A food-grade (FDA approved) drinking water hose should be used to fill water containers from the water storage tank and to distribute water in an emergency.	
		Transport water in food-grade (FDA approved) emergency water containers.	
		Ensure the emergency water supplies, and the hose and containers are accessible 24 hours a day and every day of the week, and that staff know the location of these supplies.	

		Testing and Purification
Date Completed	Date Reviewed	
		 Protect the water sources already in the facility from contamination if there are reports of broken water or sewage lines or if local officials advise conservation of clean water. To shut off incoming water, locate the main valve and turn it to the closed position. Be sure key staff members know beforehand how to perform this important procedure.
		To use the water in the pipes, let air into the plumbing by turning on the faucet in the facility at the highest level. A small amount of water will trickle out. Then obtain water from the lowest faucet in the facility.
		 To use the water in the hot-water tank, be sure the electricity or gas is off. Open the drain at the bottom of the tank. Start the water flowing by turning off the water intake valve at the tank and turning on a hot-water faucet. Refill the tank before turning the power back on, or call a professional to turn the gas back on.
		Treat all water of uncertain quality before using it for drinking, food preparation, or hygiene.
		Before treating, let any suspended particles settle to the bottom, or strain them through layers of paper towel, clean cloth, or coffee filter.
		 Boiling is the surest method to kill disease-causing organisms, including viruses, bacteria, and parasites. If the water is cloudy, filter it through a clean cloth, paper towel, or coffee filter OR allow it to settle. Then follow boiling guidelines. Bring the clear water to a rolling boil for one minute (at elevations above 6,500 feet, boil for three minutes).

		Testing and Purification - Continued
Date Completed	Date Reviewed	
		 Small quantities of filtered and settled water can be made safer to drink by using a chemical disinfectant such as unscented household chlorine bleach. Use only regular household liquid bleach that contains 5.25 to 6.0 percent sodium hypochlorite. Do not use scented bleaches, colorsafe bleaches, or bleaches with added cleaners. Because the potency of bleach diminishes with time, use bleach from a newly opened or unopened bottle. Add 16 drops (1/8 teaspoon) of bleach per gallon of water, stir and let stand for 30 minutes. The water should have a slight bleach odor. If it doesn't, then repeat the dosage and let stand another 15 minutes. If it still does not smell of bleach, discard it and find another source of water.
		 Iodine or water treatment products (sold in camping or surplus stores) are not recommended. Follow the manufacturer's instructions on the label or in the package. Iodine and iodine-containing tablets (tetraglycine hydroperiodide) or chlorine tablets are not effective against <i>Cryptosporidium</i>. Important: Water that has been disinfected with iodine is NOT recommended for pregnant women, people with thyroid problems, those with known hypersensitivity to iodine, or continuous use for more than a few weeks at a time.
		Chlorine dioxide tablets can be effective against <i>Cryptosporidium</i> if the manufacturer's instructions are followed correctly. Follow the manufacturer's instructions on the label or in the package.
		If water in pipes is suspected to be unsafe, have a plan to restrict access to that water source.

Resupply Plan/Agreement		
Date Completed	Date Reviewed	
		Have a plan for the facility and systems to connect to alternate water sources to support sprinkler system, waste water, and cooling systems.
		Be ready to communicate with local emergency management and the water company about the situation, and to request assistance for the facility.
		The facility should make arrangements/agreements with local water companies (public and/or private) to acquire water in case of an emergency to meet the facility's needs.

	Portable Supply for Evacuation		
Date Completed	Date Reviewed		
		The facility's stored water supplies should be easily portable so that supplies can be available to residents and staff along the way in the event of an evacuation.	
		The amount and container type for transport should be determined by the facility based on an assessment of the location, all-hazards analysis & individual characteristics of the facility and the population it serves.
